

Guidelines for Food Safety at Retail Establishments During Temporary Power Outages

The California Department of Public Health, Food and Drug Branch developed this guidance document for the retail food industry on what to do before, during and immediately after a power outage. The focus is on the action steps to take for potentially hazardous foods (PHF), which are those foods that can support the rapid growth of microorganisms at temperatures between 41°F and 135°F. Your local environmental health agency is primarily responsible for enforcing the current California Retail Food Code (CRFC) and may have additional information for your specific situation.

Before a Power Outage

Develop a plan of action on how to keep refrigerated foods cool in your facility. This may include consolidating foods into insulated containers or walk-in coolers, covering open display cases, and purchasing ice or dry ice from local retailers. You should also keep a supply of ice or gel packs frozen and readily accessible. Calibrated food thermometers, a battery operated clock and a temperature log will help you monitor and document the temperature of the food and the time it spent in the temperature danger zone of 41°F-135°F.

During a Power Outage

Your focus during a power outage is to keep foods out of the temperature danger zone as much as possible. Below are some action steps to take for both cold and hot foods.

Cold Foods

- Document temperature of the food and the time the power outage began.
- Keep all refrigerator/freezer doors closed as much as possible.
- Cover open, refrigerated display cases or consolidate products to lessen heat gain.

- Use ice, gel packs, or dry ice* as necessary to keep foods cold.
- Be sure the water from melting ice doesn't contaminate foods

(*Thawing dry ice releases carbon dioxide. Exercise caution when using in large quantities or in enclosed rooms.)

Hot Foods

- Document temperature of the food and the time the power outage began.
- Discard any foods in the process of being cooked that had not reached their appropriate final cooking temperature when the outage occurred.
- Cover hot food display cases with thermal blankets or lids to reduce temperature loss.

Do not prepare food if you cannot properly wash your hands, clean and sanitize food contact surfaces, or maintain other required food safety practices.
